**Title: Vulvar lipoma | Case Report**

Author Name: Rami Yousif

Affiliation: *Senior Registrar Obstetrics & gynecology, al kamel General Hospital, Mekka region, Saudi Arabia*

**Abstract (upto 300 words)**

Lipomas are widely disseminated benign mesenchymal neoplasms commonly found over the neck and upper back, shoulders, abdomen, buttocks, and proximal portions of the extremities.

Vulva localizations are rare, and very few cases have been reported. and its diagnosis is confirmed by the histopathological description of a well-circumscribed collection of mature adipose tissue.

The etiology of lipoma is still to be elucidated, but it has been reported that trauma and gene rearrangement may play a role in its development an association with gene rearrangements of chromosome has been established in cases of solitary lipomas, as has an abnormality in The HMGA2-LPP fusion gene.

We report the case of a vulvar lipoma that was diagnosed in a 29-year-old woman.

Our case is the first case of vulvar lipoma as of our knowledge to be reported in Saudi Arabia.

**Biography**

Rami Yousif a 37 years old sudanese obstetrician currently working for MOH at saudi arabia since 2019, he granted MD degree from sudan medical specialization board 2017.
